## *Thermix® black flank – improved visual appearance for perfect façades*

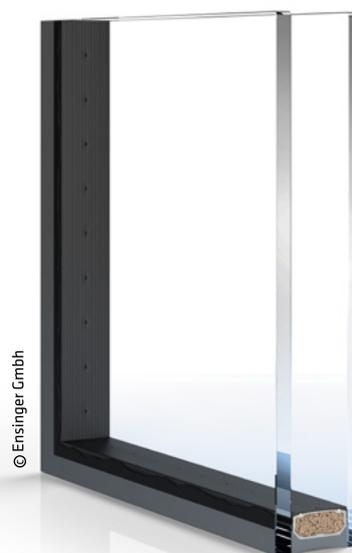

### *The simple solution for improved aesthetics*

**Glass façades provide transparency, a light environment and imposing architecture. Despite careful processing, adverse visual effects may arise in the edge zone of the glass assemblies. To prevent this, Ensinger offers a simple solution: Thermix® black flank – for a perfect visual appearance and happy building owners!**

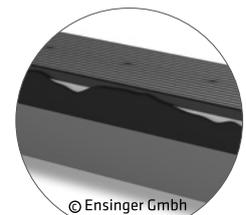

Because modern glass façades are by and large produced without frames, the edge bond of the insulating glass and therefore the spacer are in some cases in the visible area. Consequently Thermix® warm edge is also available immediately as a variant with black flanks.

#### **Thermix® black flank – more attractive, permanently:**

- Conceals the stainless steel side or irregular butyl sealing that are shining through
- Gives the façade a uniform, aesthetically convincing appearance
- Long-term effective, colour-fast and UV-resistant
- Available as an option for Thermix® TX Pro in all installation sizes
